

Intro to ggplot2

January 2020

<https://psrc.github.io/intro-ggplot2/>

Follow along with the class outline:

https://psrc.github.io/intro-ggplot2/content/class_outline.html

ggplot2

Nathan's Hot Dog Eating Contest Results, 1981-2017

* From 2011 on, separate Men's and Women's prizes have been awarded. All female champions to date have been MLE/IFOCE-affiliated.

A versatile library

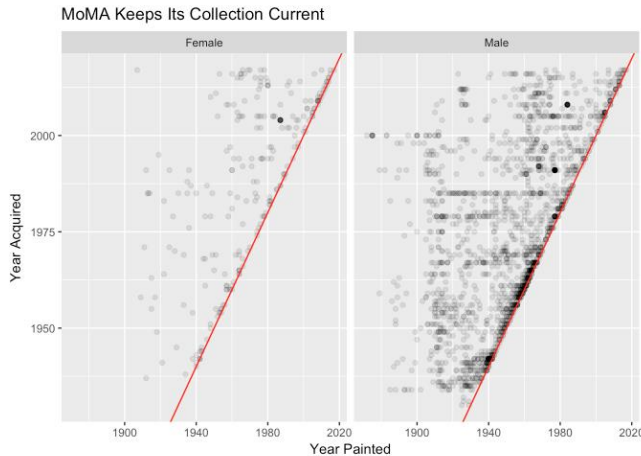

- Stand alone image
- Render in Rmarkdown reports
- Render in Shiny applications
- Integrate with other packages

Goals

- Getting started with simple graphs
- Glimpse of all the options and tools available

Agenda

1. Code along
 1. Bar Graph
 2. Other Graph Types
 3. Facets
2. Extensions
3. My favorite resources

Blue wave

■ Won seat ■ Didn't win

Why 'ggplot2'? Where
does the 2 come from ???

ggplot == ggplot2

About ggplot2

- Created by Hadley Wickham in 2005
- Based on *The Grammar of Graphics* (1999, Leland Wilkinson)

Benefits of ggplot2

- Customize and edit parts easily because everything is broken down into individual components
- Can store plots in variables
- Flexibility

Describes all the non-data ink	Theme
Plotting space for the data	Coordinates
Statistical models & summaries	Statistics
Rows and columns of sub-plots	Facets
Shapes used to represent the data	Geometries
Scales onto which data is mapped	Aesthetics
The actual variables to be plotted	Data

Grammar of Graphics: A layered approach to elegant visuals

- Member of the Tidyverse (RStudio)
- As long as you have a data frame you can use ggplot, with or without other Tidyverse packages

The tidyverse is an opinionated collection of R packages designed for data science. All package share an underlying design philosophy, grammar, and data structures.

-- tidyverse.org

TIDY DATA is a standard way of mapping the meaning of a dataset to its structure.

—HADLEY WICKHAM

In tidy data:

- each **variable** forms a **column**
- each **observation** forms a **row**
- each **cell** is a **single measurement**

each column a variable

id	name	color
1	floof	gray
2	max	black
3	cat	orange
4	donut	gray
5	merlin	black
6	panda	calico

each row an observation

Wickham, H. (2014). Tidy Data. Journal of Statistical Software 59 (10). DOI: 10.18637/jss.v059.i10

Artwork by @allison_horst

[About tidy data](#)

geom_ = geometric objects drawn to represent the data

aes(...) aka aesthetics = “Mapping the variable”

what variable (aka column) do we want to be the basis for _____

- X axis
- Y axis
- color
- fill
- shape
- size
-

- The aes() only takes mappings from the data onto the geom.
- For something fixed, set it inside the geom function but outside of aes()
- Options in the aes() is dependent on the type of geom_

To find specific aes() arguments for a geom, ask for help in the console

- ?<name of geom function>

scale_ = changing scale limits or change the **way** our data are mapped onto our geom_

Data values  Visual values of an aesthetic

Most scale functions follow the format: `scale_{aesthetic}_{method}` or `scale_{aesthetic}_{datatype}` where

- aesthetic are our aesthetic mappings such as color, fill, shape
- method is how the colors, fill colors, and shapes are chosen
- Datatype is the datatype of the variable being mapped

Scales can also be used to ...

Change scale

- Linear  Log10

Change our axes

- override the labels
- change the breaks

Your data influences which function(s) you can use

Which should I use? `scale_x_discrete` or `scale_x_continuous`? `scale_{aesthetic}_brewer` or `scale_{aesthetic}_distiller`?

CONTINUOUS

measured data, can have ∞ values within possible range.

I AM 3.1" TALL
I WEIGH 34.16 grams

DISCRETE

OBSERVATIONS CAN ONLY EXIST AT LIMITED VALUES, OFTEN COUNTS.

I HAVE 8 LEGS
and
4 SPOTS!

@allison_horst

Hadley Wickham replied

Mattan S. Ben-Shachar @mattansb · Aug 26

Wanted: a mnemonic device to remember:

brewer = discrete scale
distiller = continuous scale
fermenter = binned scale

#rstats #ggplot

4

2

6

Hadley Wickham ✓ @hadleywickham · Aug 26

brewer makes beer = low alcohol = few categories (i.e. discrete)

distiller makes liquor = high alcohol = many categories (i.e. continuous)

fermenter makes wine = somewhere in between (i.e. binned)

1

21

theme() = control the non-data part of your plot (titles, labels, fonts, background, gridlines, and legends)

There are a ton of keyword arguments you could use in theme():

<https://ggplot2.tidyverse.org/reference/theme.html>

Depending on what you're changing, you'll have to wrap your arguments with one of the following functions:

- `element_line()`: modify the line elements of the theme
- `element_text()`: to modify the text elements
- `element_rect()`: to modify the rectangle elements
- `element_blank()`: to remove the element

There are also preset themes in ggplot2

- `theme_bw()`
- `theme_minimal()`
- `theme_classic()`
- `theme_dark()`

Factors

the categorical datatype

Each unique value can be represented by a label and a level which determines its place when sorted

Character datatypes in ggplot2 will display in alphabetical order. If you want to customize the order of the values, convert that column into a factor datatype.

For example, displaying character values in non-alphabetical order (e.g. month names, Starbucks cup sizes, education attainment)

<https://plotly.com/r/>
<https://plotly.com/ggplot2/>

- Another statistical graphing library that by default provides interactive visuals
- Has ggplot2 integration

```
1 library(ggplot2)
2 library(plotly)
3
4 my.ggplot <- <insert ggplot code>
5
6 ggplotly(my.ggplot)
7
8
```

Data Visualization with ggplot2 : : CHEAT SHEET

Basics

ggplot2 is based on the **grammar of graphics**, the idea that you can build every graph from the same components: **a data set**, a **coordinate system**, and **geoms**—visual marks that represent data points.

```

    graph LR
        data --> geom
        geom --> coord[coordinate system]
        coord --> plot
    
```

To display values, map variables in the data to visual properties of the geom (**aesthetics**) like **size**, **color**, and **x** and **y** locations.

```

    graph LR
        data --> geom
        geom --> coord[coordinate system]
        coord --> plot
    
```

complete the template below to build a graph.

```

ggplot(data = DATA) +
  GEOM FUNCTION(mapping = aes(MAPPINGS)) +
  COORDINATE FUNCTION(coord = coord(position = POSITION)) +
  SCALE FUNCTION(scale = scale()) +
  THEME FUNCTION(theme = theme())
    
```

ggplot(data = mpg, aes(x = displ, y = hwy)) Build a plot that you finish by adding layers to data. you have one function per layer.

geom_point(mapping = aes(x = displ, y = hwy)) creates a complete plot with given data, geoms, and mappings. Supplies many useful default values.

last_plot() Returns the last plot
ggplot2::plot_grid(w1, w2, w3, height = 5) Saves last plot
 # or # for named "plot_grid" in working directory
 Matches file type to file extension.

Geoms

Use a geom function to represent data points, use the geom's aesthetic properties to represent variables.
 Each function returns a layer.

GRAPHICAL PRIMITIVES

```

a = geom_economics(aes(date, unemployment))
b = geom_point(aes(x = year, y = rate))
# geom_label for expanding limits

b = geom_curve(xend = x1 + 1,
               yend = y1 + 1,
               aes(x = year, y = rate, color = "red", linetype = "solid", size = 2))
# geom_label for expanding limits

b = geom_polygon(aes(group = id, x = x, y = y, fill = "blue", stroke = "black"))
# geom_rect(aes(xmin = low, xmax = high, ymin = min, ymax = max, fill = "blue", stroke = "black"))
a = geom_ribbon(aes(year, unemployment, fill = "red", linetype = "solid", alpha = 0.5, group = id))
    
```

LINE SEGMENTS

```

geom_abline(aes(slope, intercept))
geom_hline(aes(yintercept = long))
geom_vline(aes(xintercept = long))
geom_segment(aes(x1, y1, x2, y2, aes(x = x1, y = y1, x2 = x2, y2 = y2)))
    
```

ONE VARIABLE continuous

```

c = ggplot(mpg, aes(displ))
# geom_area(aes(x = "year", y = rate))
# geom_bar(aes(x = "year", y = rate))
# geom_density(aes(x = "year", y = rate))
# geom_histogram(aes(x = "year", y = rate))
# geom_freqpoly(aes(x = "year", y = rate))
# geom_line(aes(x = "year", y = rate))
# geom_point(aes(x = "year", y = rate))
# geom_smooth(aes(x = "year", y = rate))
# geom_violin(aes(x = "year", y = rate))
    
```

discrete

```

d = geom_bar()
# geom_bar(aes(x = "year", y = rate))
    
```

TWO VARIABLES

```

continuous x, continuous y
e = ggplot(mpg, aes(displ, hwy))
# geom_abline(aes(slope, intercept))
# geom_bar(aes(x = "year", y = rate))
# geom_density(aes(x = "year", y = rate))
# geom_histogram(aes(x = "year", y = rate))
# geom_freqpoly(aes(x = "year", y = rate))
# geom_line(aes(x = "year", y = rate))
# geom_point(aes(x = "year", y = rate))
# geom_smooth(aes(x = "year", y = rate))
# geom_violin(aes(x = "year", y = rate))
    
```

discrete x, continuous y

```

f = ggplot(mpg, aes(displ, hwy))
# geom_abline(aes(slope, intercept))
# geom_bar(aes(x = "year", y = rate))
# geom_density(aes(x = "year", y = rate))
# geom_histogram(aes(x = "year", y = rate))
# geom_freqpoly(aes(x = "year", y = rate))
# geom_line(aes(x = "year", y = rate))
# geom_point(aes(x = "year", y = rate))
# geom_smooth(aes(x = "year", y = rate))
# geom_violin(aes(x = "year", y = rate))
    
```

discrete x, discrete y

```

g = ggplot(diamonds, aes(carat, price))
# geom_bar(aes(x = "year", y = rate))
# geom_density(aes(x = "year", y = rate))
# geom_histogram(aes(x = "year", y = rate))
# geom_freqpoly(aes(x = "year", y = rate))
# geom_line(aes(x = "year", y = rate))
# geom_point(aes(x = "year", y = rate))
# geom_smooth(aes(x = "year", y = rate))
# geom_violin(aes(x = "year", y = rate))
    
```

THREE VARIABLES

```

h = ggplot(mpg, aes(displ, hwy, color = "year"))
# geom_bar(aes(x = "year", y = rate))
# geom_density(aes(x = "year", y = rate))
# geom_histogram(aes(x = "year", y = rate))
# geom_freqpoly(aes(x = "year", y = rate))
# geom_line(aes(x = "year", y = rate))
# geom_point(aes(x = "year", y = rate))
# geom_smooth(aes(x = "year", y = rate))
# geom_violin(aes(x = "year", y = rate))
    
```

continuous bivariate distribution

```

i = ggplot(mpg, aes(displ, hwy))
# geom_bar(aes(x = "year", y = rate))
# geom_density(aes(x = "year", y = rate))
# geom_histogram(aes(x = "year", y = rate))
# geom_freqpoly(aes(x = "year", y = rate))
# geom_line(aes(x = "year", y = rate))
# geom_point(aes(x = "year", y = rate))
# geom_smooth(aes(x = "year", y = rate))
# geom_violin(aes(x = "year", y = rate))
    
```

continuous function

```

j = ggplot(mpg, aes(displ, hwy))
# geom_bar(aes(x = "year", y = rate))
# geom_density(aes(x = "year", y = rate))
# geom_histogram(aes(x = "year", y = rate))
# geom_freqpoly(aes(x = "year", y = rate))
# geom_line(aes(x = "year", y = rate))
# geom_point(aes(x = "year", y = rate))
# geom_smooth(aes(x = "year", y = rate))
# geom_violin(aes(x = "year", y = rate))
    
```

visualizing error

```

k = ggplot(mpg, aes(displ, hwy))
# geom_bar(aes(x = "year", y = rate))
# geom_density(aes(x = "year", y = rate))
# geom_histogram(aes(x = "year", y = rate))
# geom_freqpoly(aes(x = "year", y = rate))
# geom_line(aes(x = "year", y = rate))
# geom_point(aes(x = "year", y = rate))
# geom_smooth(aes(x = "year", y = rate))
# geom_violin(aes(x = "year", y = rate))
    
```

maps

```

l = data.frame(murder = USArrests$Murder,
               pop = USArrests$Pop,
               map = state.data("murder"))
# geom_bar(aes(x = "year", y = rate))
# geom_density(aes(x = "year", y = rate))
# geom_histogram(aes(x = "year", y = rate))
# geom_freqpoly(aes(x = "year", y = rate))
# geom_line(aes(x = "year", y = rate))
# geom_point(aes(x = "year", y = rate))
# geom_smooth(aes(x = "year", y = rate))
# geom_violin(aes(x = "year", y = rate))
    
```
